

Certificate for
Low Carbon Urban Heating

This is to certify that
This building
is supplied with district heating

The district heating demand in our area is supplied by The Heat Transmission Company, **VEKS**, which is part of the integrated district heating system in Greater Copenhagen. The heat is produced by waste to energy and Combined Heat and Power (CHP). District heating is the most cost effective way of heat production for the society of Denmark.

Our CO₂ emission is only 113 kg/MWh

This is three times less than the emission from an oil boiler, and we expect it will be almost zero within 20 years.

Moreover the heat production is concentrated on a few heat sources with efficient flue-gas cleaning and strong air-pollution control.
